## • Model = Global Model + Local Model(s) + Noise

- SVM can find both the global and the local models
- Conflicting criteria: training error and model complexity
- Users have to specify a weighting factor C for a trade-off
- Local models: those for higher weights on training error

#### Solution

Embed multi-objective evolutionary algorithms instead of the quadratic programming approach into SVM.

## The Primal SVM Problem

#### Primal SVM Problem

The basic form of the primal SVM optimization problem is the following:

minimize 
$$\frac{1}{2} ||w||^2 + C \sum_{i=1}^n \xi_i$$
  
subject to  $\forall i : y_i (\langle w, x_i \rangle + b) \ge 1 - \xi_i$   
and  $\forall i : \xi_i \ge 0$ .

## Multiple Conflicting Objectives

## Primal Objective 1

$$\begin{array}{l} \text{minimize } \frac{1}{2} ||w||^2 \\ \text{subject to } \forall i : y_i \left( \langle w, x_i \rangle + b \right) \geq 1 - \xi_i \\ \text{and } \forall i : \xi_i \geq 0 \end{array}$$

Primal Objective 2

$$\begin{array}{l} \text{minimize } \sum_{i=1}^{n} \xi_{i} \\ \text{subject to } \forall i : y_{i} \left( \langle w, x_{i} \rangle + b \right) \geq 1 - \xi_{i} \\ \text{and } \forall i : \xi_{i} \geq 0. \end{array}$$

| Outline | Introduction | Multi-Objective Learning | Results   | Conclusion |

|         | 000          | • <b>00</b> 0000         | 000000000 |            |
|         |              |                          |           |            |

## Objective 1: Maximizing the Margin

 Introduce positive Lagrange multipliers α for the first set of inequality constraints and multipliers β for the second set of inequality constraints:

$$L_{p}^{(1)} = \frac{1}{2} ||w||^{2} - \sum_{i=1}^{n} \alpha_{i} (y_{i} (\langle w, x_{i} \rangle + b) + \xi_{i} - 1) - \sum_{i=1}^{n} \beta_{i} \xi_{i}$$

• Set the derivatives to 0:

$$\frac{\partial L_p^{(1)}}{\partial w}(w, b, \xi, \alpha, \beta) = w - \sum_{i=1}^n y_i \alpha_i x_i = 0,$$
  
$$\frac{\partial L_p^{(1)}}{\partial b}(w, b, \xi, \alpha, \beta) = \sum_{i=1}^n \alpha_i y_i = 0,$$
  
$$\frac{\partial L_p^{(1)}}{\partial \xi_i}(w, b, \xi, \alpha, \beta) = -\alpha_i - \beta_i = 0$$

3

(4月) (1日) (日)

| Outline | Introduction | Multi-Objective Learning | Results   | Conclusion |
|---------|--------------|--------------------------|-----------|------------|
|         | 000          | 000000                   | 000000000 |            |

## Plugging the Derivatives into the Primal

 Plugging the derivatives into the primal objective function L<sup>(1)</sup><sub>p</sub> delivers

$$\begin{aligned} \frac{1}{2} \frac{1}{p} &= \frac{1}{2} ||w||^2 - \sum_{i=1}^n -\alpha_i y_i \left\langle \sum_{j=1}^n \alpha_j y_j x_j, x_i \right\rangle + \sum_{i=1}^n \alpha_i \\ &= \sum_{i=1}^n \alpha_i - \frac{1}{2} \sum_{i=1}^n \sum_{j=1}^n \alpha_i \alpha_j y_i y_j \left\langle x_i, x_j \right\rangle \end{aligned}$$

- The Wolfe dual must be maximized leading to the first objective of the multi-objective SVM
- Result is very similar to the dual SVM problem stated above but without the upper bound C for the α<sub>i</sub>

Introduction

Multi-Objective Learning 000000

Results

イロト イヨト イヨト イヨト

Conclusion

## The First Objective of the MO-SVM

First Objective The first SVM objective (maximize margin) is defined as: maximize  $\sum_{i=1}^{n} \alpha_{i} - \frac{1}{2} \sum_{i=1}^{n} \sum_{j=1}^{n} y_{i} y_{j} \alpha_{i} \alpha_{j} k(x_{i}, x_{j})$ subject to  $\alpha_i \geq 0$  for all  $i = 1, \ldots, n$ and  $\sum_{i=1}^{n} \alpha_i y_i = 0$ i-1

## **Objective 2: Minimize Training Errors**

• We again add positive Lagrange multipliers  $\alpha$  and  $\beta$ :

$$L_p^{(2)} = \sum_{i=1}^n \xi_i - \sum_{i=1}^n \alpha_i \left( \left( y_i \left\langle w, x_i \right\rangle + b \right) + \xi_i - 1 \right) - \sum_{i=1}^n \beta_i \xi_i$$

• Setting the derivatives to 0 leads to slightly different conditions on the derivatives of  $L_p^{(2)}$ :

$$\frac{\partial L_p^{(2)}}{\partial w}(w, b, \xi, \alpha, \beta) = -\sum_{i=1}^n y_i \alpha_i x_i = 0,$$
$$\frac{\partial L_p^{(2)}}{\partial b}(w, b, \xi, \alpha, \beta) = \sum_{i=1}^n \alpha_i y_i = 0,$$
$$\frac{\partial L_p^{(2)}}{\partial \xi_i}(w, b, \xi, \alpha, \beta) = 1 - \alpha_i - \beta_i = 0$$

| Outline | Introduction | Multi-Objective Learning | Results   | Conclusion |
|---------|--------------|--------------------------|-----------|------------|
|         | 000          | 0000000                  | 000000000 |            |

## Plugging the Derivatives into the Primal

• Plugging the derivatives into the  $L_p^{(2)}$  cancels out most terms:

$$L_{p}^{(2)} = \sum_{i=1}^{n} \xi_{i} - \sum_{i=1}^{n} \alpha_{i}\xi_{i} + \sum_{i=1}^{n} \alpha_{i} - \sum_{i=1}^{n} \beta_{i}\xi_{i}$$

• Together with the third derivative we can replace the  $\beta_i$  by  $1 - \alpha_i$  leading to

$$L_p^{(2)} = \sum_{i=1}^n \alpha_i \xi_i - \sum_{i=1}^n \alpha_i \xi_i + \sum_{i=1}^n \alpha_i$$
$$L_p^{(2)} = \sum_{i=1}^n \alpha_i$$

 Maximizing the Wolfe dual leads to the second objective of the multi-objective SVM

Second Objective

The second SVM objective (minimize error) is defined as:

maximize 
$$\sum_{i=1}^{n} \alpha_i$$
  
subject to  $\alpha_i \ge 0$  for all  $i = 1, ..., n$   
and  $\sum_{i=1}^{n} \alpha_i y_i = 0$

| Used C  | bjectives    |                                    |         |            |

#### Set of all Objectives

Maximize the terms

$$-\sum_{i=1}^{n}\sum_{j=1}^{n}y_{i}y_{j}\alpha_{i}\alpha_{j}k(x_{i},x_{j}),$$
  
nd 
$$\sum_{i=1}^{n}\alpha_{i}$$

subject to  $\alpha_i \geq 0$  for all  $i = 1, \ldots, n$ 

а

The result will be a Pareto front showing all models which are optimal for all possible weightings between both criteria.
